

## Designer Condos, San Francisco, CA

### Scenario

Originally constructed in 1963, these designer condos reside near historic Fisherman's Wharf in San Francisco. Due to the buildings age, power was limited to a single 100A panel in the garage. Starting with a single dual-charger the building quickly needed to upgrade service to a 200A panel which supplied chargers to two additional residents. Once capacity was reached the building contacted EverCharge before they upgraded service again.

### Solution

EverCharge quickly removed the charge stations that were already installed and replaced them with intelligent stations covering 6 residents who needed in-home charging. Afterwards EverCharge upgraded the garage with a 400A panel which will allow up to 40 residents to install chargers directly in their space. By leveraging EverCharge technology the building not only covered the current demand but also can scale as needed without any additional infrastructure.
